

(Line 1-5 of page 1 of 2257270).

The present invention concerns new compounds composed of N-acyl (α or β)-aspartyl glutamate acids and salts of configuration L or D-L, and their use in formulating medicines. It involves especially a process to formulate N-acyl (α or β)-aspartyl glutamates and their salts.

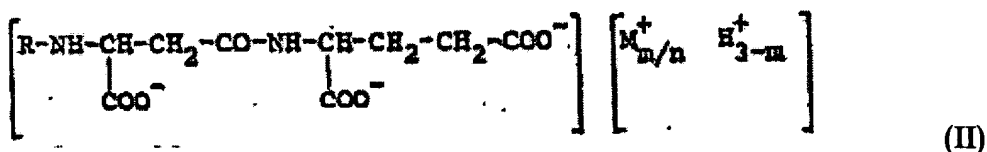

(Claim 1 of 2257270)

1. - New compounds, especially for pharmaceutical use, characterized in that they are composed of N-acyl (α or β)-aspartyl glutamate acids and salts of configuration L or D-L represented by the following generic formulas, respectively.

for the α isomer form

for the β isomer form

wherein:

- M represents an n valence cation that can be:
 - . either a metal cation or
 - . an organic compound cation such as:
 - an amino alcohol
 - an amino acid
 - a quaternary ammonium compound such as a betaine or a choline.
 - R represents an acyl group.
 - m can vary from 0 to 3 according to the number of carboxylic functions.
- END.
